PHP2Shell fixes are out for Synology and QNAP storage boxes

Published 1 November 2026. Read the full story, sources and any updates at
digitaladvisors.com.au/journal/php2shell-synology-qnap-nas-updates/

- [ ] **Check which system your storage box runs.** Look for Synology DSM or QNAP QTS, QuTS hero or QuTScloud, or ask whoever set it up.
- [ ] **On Synology, update PHP in Package Center.** Do it if you use Web Station, WordPress, Calendar, MailStation, Joomla, MediaWiki, phpMyAdmin, KodExplorer, vtigerCRM or IDrive.
- [ ] **Update MailStation separately.** Synology says it needs a manual update through Package Center.
- [ ] **Switch off affected packages on Synology systems older than DSM 6.2.** Leave them off until you move to a supported DSM version.
- [ ] **On QNAP, run Live Update.** Go to Control Panel > System > Firmware Update > Live Update, then update Notes Station 3 in App Center if you use it.
- [ ] **Ask for fixes for PHP in containers and third-party apps.** QNAP's updates don't cover them, so go to whoever made the image or app.
- [ ] **Turn off port forwarding and UPnP for the storage box.** Use a VPN for remote access instead.
- [ ] **Disconnect a box you think has been attacked.** Change all passwords, then contact QNAP support for a QNAP box, or the ACSC on 1300 CYBER1 (1300 292 371).
